SUMMARY

Finance graduate and systematic futures strategy developer. Builds and validates trading strategies for CME futures with realistic costs, sealed holdout years and placebo tests; runs automated strategies live with risk controls. Strong at finding where a backtest or analysis fools itself: look-ahead bias, overfitting, wrong costs, time-zone and data errors.

EXPERIENCE

Independent Systematic Futures Research & Live Trading **Oct 2026 – Present**

Self-directed; CME index futures (NQ, ES; also CL, GC, 6E, ZN) for prop-firm (Apex) accounts

- Tested and ranked 370+ strategy ideas from academic papers, practitioner research and books in one S-to-F tier list, documenting why each passes or fails.
- Designed the validation standard: commissions and slippage on every fill, results by year from 2018, a sealed 2023+ holdout, random-entry placebos, walk-forward, bootstrap and Monte Carlo at trading size, and a significance bar that rises with the number of ideas tried.
- Replicated published order-flow research on tick-level order-book data and showed where reported edges disappear after costs or when in-sample filters are retested.
- Deployed automated strategies live via MultiCharts and Rithmic on a Windows VPS, with order-routing checks, a remote kill switch, heartbeats, a pre-market check and phone alerts.
- Reconciled live trades against the backtest (15 of 15 matched) to separate execution errors from normal variance after a losing stretch; tested sizing alternatives under trailing-drawdown rules.
- Directed AI agents (Claude Code, Codex) for research, independent strategy checking and code review; verified every result by running it.

Freelance Strategy Developer & Coder **2023 – Present**

Self-employed

- Coded and debugged TradingView and MultiCharts strategies for retail traders.
- Built Python backtests for clients and reviewed strategies for look-ahead bias, overfitting and unrealistic cost assumptions.

EDUCATION

University of San Francisco **2023**

B.S., Finance

SKILLS

Finance & trading: futures market structure, algorithmic trading, backtest validation, order flow, risk and position sizing, prop-firm drawdown rules, quantitative research review.

Technical: Python (pandas, NumPy), MultiCharts PowerLanguage / EasyLanguage, Rithmic, Git / GitHub, Windows VPS operations, statistics (bootstrap, Monte Carlo, deflated Sharpe).

AI: multi-agent workflows with Claude Code and Codex; writing task specs; verifying model output.
