! CAUTION — DO NOT RUN ANY OF THESE STRATEGIES BY ITSELF

At most one trade per strategy per week. The bootstrap shows a high probability of losing a funded account to the inactivity rule. Use them only as an addition to a set of strategies that trade on other days.

// STRATEGY RESEARCH NOTE

TRIPLE OPEN

Three long-only micro-futures strategies on ES and NQ that all trade one window: the Globex session that opens Sunday evening and belongs to Monday. Published as a portfolio add-on, not as a standalone system.

// ABSTRACT

THE CASE.

Three rule sets, one shared window. Each buys micro futures at the close of Sunday's 19:00 CT bar, the first bar of Monday's Globex session, and exits on Monday. Two trade MES, one trades MNQ. Each has one simple filter (Friday up, price near its EMA, or a daily ADX/DI condition) and **no stop loss** in the tested settings.

All figures come from out-of-sample MultiCharts exports, 2024-01-07 to 2026-09-21: **257 trades, $77,399 net** at 5 micros per strategy, profit factor 2.12, win rate 65.0%, max closed-trade drawdown ($11,093). Commission and slippage are already inside every number. No in-sample data was supplied, so nothing here compares in- and out-of-sample.

The three were then bootstrapped together as one portfolio on the Apex 50K EOD rules. Evaluation: **46.9%** pass rate at 7/7/7 micros. Funded: **40.3%** chance of a first payout at 2/2/2 micros, but **57.3%** of funded accounts are closed for inactivity before that payout. Drawdown is not the problem; trade frequency is.

// READ THIS FIRST

Do not run any of these strategies alone. They trade at most once a week, on the same day, and can go weeks without a trade. Their value is as an addition to a set of strategies that trade Tuesday to Friday.

01

// AS TESTED, NOT AS WRITTEN ELSEWHERE

SPECIFICATION.

All three share the same skeleton: enter at the **close of Sunday's 19:00 CT bar** (Globex reopen, already Monday's session), hold into Monday, exit on time or target. Monday holidays are skipped via a hard-coded holiday list. Signals are computed on the mini series (Data2), orders go to the micro series (Data1).

// THE SHARED EDGE, AND THE SHARED RISK

All three are long the first hours of the week. That is one bet expressed three ways, not three independent bets: daily P&L correlation is +0.57 between the two ES strategies, +0.30 and +0.19 against NQ. On 95 of the 126 trading days in the sample, more than one of them was in the market.

// NO STOP LOSS

The tested settings run with StopPts = 0. Risk is limited only by the time exit. Worst adverse excursion in the sample was $8,208 on 5 MNQ and $5,118 on 5 MES. The code has a stop input; any stop you add changes the results in this document.

02

// MULTICHARTS

CHART SETUP.

// DATA SERIES

SERIES	SYMBOL	BARS	ROLE
Data1	MES or MNQ	5 min	orders
Data2	ES or NQ	5 min	signal

Insert Data2 via *Insert > Series*, same timeframe. L656ES and L644ES use MES + ES, L644NQ uses MNQ + NQ. One study per chart, signal type, no functions to create.

// SESSION AND TIME

Time zone	Exchange (Chicago, CT)
Session	Full CME Globex 17:00-16:00
Bar stamp	Close of bar
Automation	Off until you enable it

// TIMEZONE — READ BEFORE THE FIRST RUN

Everything is in **Exchange time (Central)**. The session boundaries (08:30 RTH open, 12:00, 15:00, 16:30 session roll) are **hard-coded**, so shifting the entry and exit inputs alone does not fix a wrong chart time zone. The Bridge's own bars are keyed Eastern: switch the chart to Exchange time before loading these. Nothing errors if you get it wrong; it silently trades a different hour.

// COSTS

The exports that produced every number here were run with $5 commission and $1 slippage per trade, already inside Profit ($). Set the real micro costs in the strategy properties when you run it yourself.

// INPUTS AS TESTED (= CODE DEFAULTS, V1.1)

INPUT	L656ES	L644ES	L644NQ
EntryTime	1900	1900	1900
ExitTime	1555	1555	1555
SessionWeekday	1 (Mon)	1 (Mon)	1 (Mon)
StopPts	0 (off)	0 (off)	0 (off)
TargetPts	100	100	100
MaxBarsInTrade	192	—	—
Filter	—	EMA 200, ±0.75 ATR	ADX 7, 10 to 50
NumContracts	5 MES	5 MES	5 MNQ

// SIZING

5 micros per strategy is the size the backtests were exported at. The portfolio bootstrap in §05/§06 re-sizes the three together: 7/7/7 micros for the evaluation, 2/2/2 micros once funded.

03

// OUT-OF-SAMPLE, 5 MICROS EACH

PERFORMANCE.

// NET PROFIT	// PROFIT FACTOR	// WIN RATE	// MAX DRAWDOWN
$77,399	**2.12**	**65.0%**	**-$11,093**
257 trades, costs included	all three combined	avg win/loss 1.15	closed-trade, combined

STRATEGY	TRADES	NET	PF	WIN %	AVG WIN	AVG LOSS	CRV	MAX DD
L656ES	73	$21,818	2.80	67.1%	$693	($505)	1:1.37	($2,049)
L644ES	119	$32,046	1.89	59.7%	$959	($751)	1:1.28	($6,452)
L644NQ	65	$23,536	2.14	72.3%	$939	($1,145)	1:0.82	($8,396)
Combined	**257**	**$77,399**	**2.12**	**65.0%**	**$875**	**($765)**	**1:1.15**	**($11,093)**

DERIVED FROM THE EXPORTED TRADE LOGS · 2024-01-07 TO 2026-09-21 · CRV = RISK : REWARD FROM AVG LOSS / AVG WIN

// BY YEAR, COMBINED

YEAR	TRADES	NET P&L
2024	99	$3,699
2025	100	$32,777
2026	58	$40,923

22 OF 33 MONTHS POSITIVE

// READING THE TABLE

Win rates are high (60-72%) and the average winner is only slightly larger than the average loser. L644NQ is the outlier: CRV 1:0.82, its 100-point target caps every winner at $989 while losers are uncapped, so it lives on a 72% hit rate. 2024 contributed only $3,699; almost all profit is 2025-2026.

> *Positive on every strategy, but the sample is 257 trades over 2.7 years, all long, all on Mondays. That is a thin base, and the profit is concentrated in the last two years.*

CONCLUSION OF §03

04

// VISUAL INSPECTION

EQUITY / DD.

FIG. 1 CUMULATIVE NET P&L PER STRATEGY AND COMBINED, 5 MICROS EACH

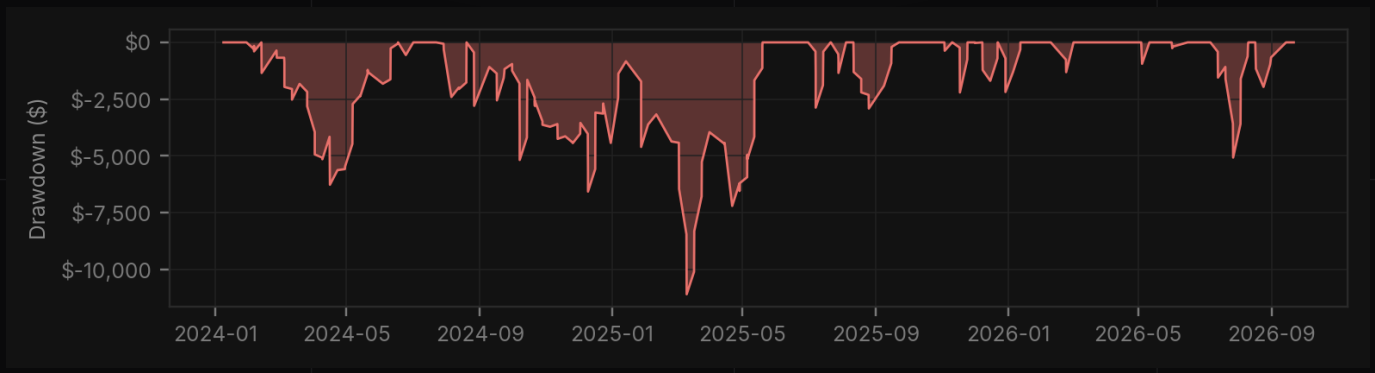

FIG. 2 COMBINED CLOSED-TRADE DRAWDOWN

FIG. 3 P&L PER TRADE

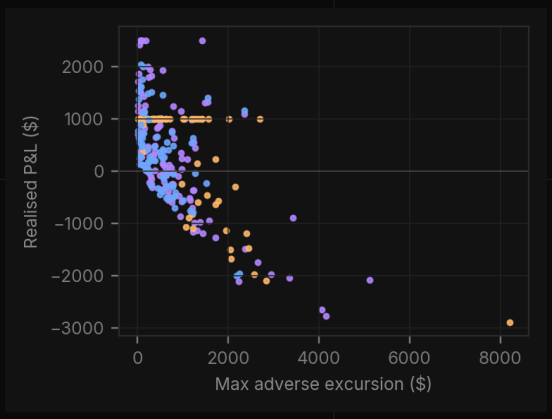

FIG. 4 ADVERSE EXCURSION VS REALISED P&L

Fig. 3: the flat line of L644NQ winners at $989 is the 100-point target. Fig. 4: without a stop, several trades sat $2,000-$8,000 under water intraday before resolving. That excursion is what a trailing-drawdown account actually feels.

05

// ALL THREE AS ONE PORTFOLIO

EVALUATION.

The three trade logs were resampled together, day by day, as one book on the **Apex 50K EOD** rules: $3,000 target, $2,000 EOD trailing drawdown, 30-day deadline, 20,000 simulations. Full out-of-sample range, costs inside. Mix and size were optimised by the notebook; it chose equal weight.

// PASS RATE	// TRADE-LEVEL	// DAYS TO PASS	// EVALS PER PASS
46.9%	**54.4%**	**8.9**	**2.1**
7/7/7 micros, daily engine	same size, intraday engine	avg weekdays (~2 trading days)	expected attempts

// SIZE SWEEP, EQUAL WEIGHT

MICROS	PASS	P95 DD	DAYS
3/3/3	34.3%	$2,151	13.6
5/5/5	43.5%	$2,724	10.6
7/7/7	46.9%	$3,316	9.0

SIZES ABOVE 2.5 MINI TOTAL NOT SIMULATED (MODEL CAP)

// ROBUSTNESS, 7/7/7 MICROS

RESAMPLING	PASS
1-day blocks (iid)	47.2%
5-day blocks	50.8%
10-day blocks	46.6%
Holdout (last 204 days)	46.9%

// HOW THE FAILURES SPLIT

At 7/7/7 micros the #1 failure is drawdown (33.2%). At the live-like 5/5/5 size, time-outs are as common as drawdown failures: with one trading day a week, a 30-day evaluation holds only about four chances to trade.

// STAGED SIZING

Starting smaller and scaling to 7/7/7 after +$1,000 lowered the pass rate in every variant tested. Time spent trading small costs more than the protection is worth under a deadline.

// TRADE-LEVEL CAVEAT

The intraday engine (54.4%) sees higher drawdowns (P95 $3,884) because it checks excursions inside the trade. Both numbers are simulations of the same 252 trades, not two independent confirmations.

> *The basket can pass an evaluation roughly one time in two. Resampling scheme and holdout agree, which is the most reassuring line in this document.*

CONCLUSION OF §05

06

// FIRST PAYOUT AND LIFETIME

FUNDED.

Funded rules as modelled: 5 qualifying days of at least $250, safety net before the first withdrawal, EOD trailing drawdown locking at +$100, and the inactivity rule (2 days of at least $50 profit per rolling 30 calendar days). No deadline: an account runs until it qualifies, blows, or is closed.

// PAYOUT CHANCE	// DAYS TO PAYOUT	// AVG PAYOUT	// CLOSED INACTIVE
40.3%	**30**	**$1,294**	**57.3%**
2/2/2 micros, first payout	median, P90 43	median $1,500, E[pay] $522	before the first payout

// FIRST PAYOUT BY SIZE

MICROS	QUALIFY	BLOWN	INACTIVE	AVG PAY	E[PAY]
2/2/2	40.3%	2.4%	57.3%	$1,301	$524
3/3/3	36.7%	7.1%	56.1%	$1,478	$543
4/4/4	22.8%	22.6%	54.6%	$1,493	$341
5/5/5	20.3%	25.0%	54.7%	$1,500	$305
6/6/6	15.8%	30.2%	54.0%	$1,500	$237

// LIFETIME, 6-PAYOUT LADDER ($13,000 MAX)

MICROS	E[TOTAL]	P(≥1)	BLOWN	INACT.
2/2/2	$1,005	41%	3%	97%
3/3/3	$912	37%	7%	92%
4/4/4	$485	24%	22%	78%
5/5/5	$417	21%	24%	76%

P(FULL LADDER) 0.4% · AVG 0.68 PAYOUTS · AVG LIFE 48 TRADING DAYS

// ACCOUNT ECONOMICS, 2/2/2 MICROS

Eval attempts per pass	2.1
Acquisition ($100/eval)	$213
E[net], lifetime plan	$652
Multiple on cost	2.8x
E[net], monthly plan	$599 / 2.5x

> *Funded, the basket almost never blows up. It dies quietly: 97% of accounts end closed for inactivity, most of them before the first payout.*

CONCLUSION OF §06

07

// WHY THIS IS AN ADD-ON

INACTIVITY.

// ACTIVE DAYS	// TRADING DAYS	// INACTIVE, EARLY	// INACTIVE, LIFETIME
122	**~4 / mo**	**57.3%**	**96.7%**
of 681 weekdays (18%)	all on Mondays	before 1st payout	vs 2-3% blown

Apex closes a funded account that does not produce **2 days of at least $50 net profit within a rolling 30 calendar days**. All three strategies trade the same day, so the whole basket has about four trading days a month. Two of those four have to be winners above $50, every month, forever. With a 65% win rate that fails regularly, and each failure is permanent.

Reducing size to protect the drawdown makes it worse: at 2 micros each, a winning Monday is often below the $50 activity threshold and far below the $250 qualifying-day threshold for payouts.

// WHAT FIXES IT

Not a better Monday strategy. The fix is more active days: combine the basket with strategies that trade Tuesday to Friday. Every extra independent trading day per week lowers the inactivity closure rate far more than any change to these three rules could. Re-run the bootstrap with your full set before trading it funded.

// CHECK THE RULE

The inactivity rule is modelled from Apex support documentation as 2 days of ≥$50 per 30 calendar days (22 trading days). Verify the current wording on your Apex dashboard. It decides this result more than any other assumption.

> *On its own this basket is an evaluation tool with a short funded life. Inside a portfolio that trades every day, its Monday edge becomes useful.*

CONCLUSION OF §07

08

// WHAT THIS DOCUMENT DOES NOT SHOW

VERDICT.

// ANALYSES NOT PERFORMED

In-sample vs out-of-sample	No IS data
Walk-forward	Not performed
Parameter sensitivity	Not performed
Stop-loss variants	Not performed
Tick-level fills	Not performed
Live track record	None

// 01, SMALL SAMPLE

257 trades in 2.7 years; 126 distinct trading days. Confidence intervals in §05/§06 are Monte Carlo noise only, not uncertainty about the edge.

// 02, NO STOP

Tested without a protective stop. Worst excursion $8,208 on 5 MNQ. Gap risk on the Sunday reopen is real.

// 03, ONE BET

All long, all Monday, correlated up to +0.57. A bad Monday regime hits all three at once.

// 04, SELECTION BIAS

The mix was chosen on the same history it is evaluated on. The holdout check helps; it does not remove this.

// 05, CALENDAR ANOMALIES DECAY

Published weekend and DST effects have weakened after publication before. 2024 was nearly flat.

UNFINISHED / ADD-ON

Three simple Monday rules with a positive out-of-sample record and a portfolio bootstrap that passes an Apex 50K evaluation about **47%** of the time. Funded, they rarely blow up but are usually closed for **inactivity**. Not validated, not a standalone system.

// HOW TO USE IT

Add the basket to a set of strategies that trade on other days. Re-bootstrap the full set. Eval 7/7/7, funded 2/2/2 micros is only the answer for the basket alone.

// WHAT NOT TO DO

Do not run one of them alone. Do not run the three alone on a funded account. Do not add a stop and assume these statistics still apply.

// WHERE TO START

Stop-loss variants, a Friday-evening or Tuesday twin, and a walk-forward on the filters are all open. The code is attached so it can be taken apart.

Not financial advice. Backtested and simulated results are hypothetical, carry the benefit of hindsight and do not represent actual trading. All figures derive from out-of-sample MultiCharts exports ($5 commission, $1 slippage per trade) and one Monte Carlo notebook; no independent re-execution against raw market data was performed. Prop-firm rules are modelled, not guaranteed, and change. Past performance does not indicate future results.
